Index ..................................................................................................................108
Congratulations on your purchase of your SMCD3GN2 Wireless Cable Modem Gateway. Your SMCD3GN2 Wireless Cable Modem Gateway is the ideal all-in-one wired and wireless solution for the home or business environment. SMC is proud to provide you with a powerful, yet simple communication device for connecting your local area network (LAN) to the Internet.

This user manual contains all the information you need to install and configure your new SMCD3GN2 Wireless Cable Modem Gateway.
Key Features

The following list summarizes the Gateway’s key features.

- Integrated, CableLabs-compliant DOCSIS 1.1/2.0/3.0 cable modem
- Four 10/100/1000 Mbps Auto-Sensing LAN ports with Auto-MDI/MDIX
- High-speed 300 Mbps IEEE 802.11n Wireless Access Point
- Dynamic Host Configuration Protocol (DHCP) for dynamic IP configuration, and Domain Name System (DNS) for domain name mapping
- One USB 2.0 port
- IEEE 802.11 b/g/n interoperability with multiple vendors
- Wireless WEP, WPA, and WPA2 encryption, Hide SSID, and MAC Filtering
- VPN pass-through support using PPTP, L2TP, or IPSec
- Advanced SPI firewall Gateway for enhanced network security from attacks over the Internet:
  - Firewall protection with Stateful Packet Inspection
  - Client privileges
  - Hacker prevention
  - Protection from denial of service (DoS) attacks
  - Network Address Translation (NAT)
- Universal Plug and Play (UPnP) enables seamless configuration of attached devices
- Quality of Service (QoS) ensures high-quality performance with existing networks
- Effortless plug-and-play installation
- Intuitive graphical user interface (GUI) configuration, regardless of operating system
- Comprehensive front panel LEDs for network status and troubleshooting
- Compatible with all popular Internet applications
Document Organization

This document consists of four chapters and two appendixes.

- **Chapter 1** - describes the contents in the Gateway package, system requirements, and an overview of the Gateway’s front and rear panels.
- **Chapter 2** - describes how to install the Gateway.
- **Chapter 3** - describes how to configure TCP/IP settings on the computer you will use to configure the Gateway.
- **Chapter 4** - describes how to configure the Gateway.
- **Appendix A** - contains compliance information.
- **Appendix B** - lists the Gateway’s technical specifications.

Document Conventions

This document uses the following conventions to draw your attention to certain information.

Safety and Warnings

This document uses the following symbols to draw your attention to certain information.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Meaning</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>📘</td>
<td>Note</td>
<td>Notes emphasize or supplement important points of the main text.</td>
</tr>
<tr>
<td>💡</td>
<td>Tip</td>
<td>Tips provide helpful information, guidelines, or suggestions for performing tasks more effectively.</td>
</tr>
<tr>
<td>⚠️</td>
<td>Warning</td>
<td>Warnings indicate that failure to take a specified action could result in damage to the device.</td>
</tr>
<tr>
<td>💥</td>
<td>Electric Shock Hazard</td>
<td>This symbol warns users of electric shock hazard. Failure to take appropriate precautions such as not opening or touching hazardous areas of the equipment could result in injury or death.</td>
</tr>
</tbody>
</table>
Typographic Conventions
This document also uses the following typographic conventions.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Bold</strong></td>
<td>Indicates text on a window, other than the window title, including menus, menu options, buttons, fields, and labels.</td>
</tr>
<tr>
<td><em>Italic</em></td>
<td>Indicates a variable, which is a placeholder for actual text provided by the user or system. Angled brackets (&lt; &gt;) are also used to indicate variables.</td>
</tr>
<tr>
<td><code>screen/code</code></td>
<td>Indicates text that is displayed on screen or entered by the user.</td>
</tr>
<tr>
<td><code>&lt; &gt; angled brackets</code></td>
<td>Indicates a variable, which is a placeholder for actual text provided by the user or system. Italic font is also used to indicate variables.</td>
</tr>
<tr>
<td><code>[]</code> square brackets</td>
<td>Indicates optional values.</td>
</tr>
<tr>
<td><code>{}</code> braces</td>
<td>Indicates required or expected values.</td>
</tr>
<tr>
<td>vertical bar</td>
<td>Indicates that you have a choice between two or more options or arguments.</td>
</tr>
</tbody>
</table>
1 Getting to Know Your Gateway

Before you install your SMCD3GN2 Wireless Cable Modem Gateway, check the package contents and become familiar with the Gateway’s front and back panels.

The topics covered in this chapter are:

- Unpacking Package Contents (page 10)
- System Requirements (page 10)
- Front Panel (page 11)
- Configuring Wireless Security (page 13)
- Rear Panel (page 13)
- Restoring Factory Defaults (page 14)
Unpacking Package Contents

Your SMCD3GN2 package should include the following items:

- One SMCD3GN2 Wireless Cable Modem Gateway
- One power cord
- One Category 5E Ethernet cable
- One CD that contains this User Manual

System Requirements

To complete the installation, you will need the following items:

- Provisioned Internet access on a cable network that supports cable modem service
- A computer with a wired network adapter with TCP/IP installed
- A Java-enabled Web browser, such as Microsoft Internet Explorer 5.5 or above
- Microsoft® Windows® 2000 or higher for USB driver support
Front Panel

The front panel of your SMCD3GN2 Wireless Cable Modem Gateway contains a set of light-emitting diode (LED) indicators. These LEDs show the status of the Gateway and simplify troubleshooting. The front panel also contains a WPS button for configuring wireless security automatically.

Figure 1 shows the front panel of your SMCD3GN2 Wireless Cable Modem Gateway. Table 1 describes the front panel LEDs.
### Table 1. Front Panel LEDs

<table>
<thead>
<tr>
<th>LED</th>
<th>Color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>POWER</td>
<td>Green</td>
<td><strong>ON</strong> = power is supplied to the Gateway. <strong>OFF</strong> = power is not supplied to the Gateway.</td>
</tr>
<tr>
<td>DS</td>
<td>Green</td>
<td>Blinking = scanning for DS channel. <strong>ON</strong> = synchronized on 1 channel only.</td>
</tr>
<tr>
<td></td>
<td>Blue</td>
<td><strong>ON</strong> = synchronized with more than 1 channel (DS Bond mode).</td>
</tr>
<tr>
<td>DS and US</td>
<td>Green</td>
<td>Both DS and US blinking together = operator is performing maintenance.</td>
</tr>
<tr>
<td></td>
<td>Blue</td>
<td><strong>ON</strong> = ranging is complete, operate with more than 1 channel (US Bond mode).</td>
</tr>
<tr>
<td>US</td>
<td>Green</td>
<td>Blinking = ranging is in progress. <strong>ON</strong> = ranging is complete on 1 channel only. <strong>OFF</strong> = scanning for DS channel.</td>
</tr>
<tr>
<td></td>
<td>Blue</td>
<td><strong>ON</strong> = ranging is complete, operate with more than 1 channel (US Bond mode).</td>

</tr>
</tbody>
</table>
Configuring Wireless Security

The front panel has a **WPS** button for configuring wireless security automatically. Pressing this button for 5 seconds automatically configures wireless security. If the client device supports WPS Push Button Configuration (PBC), press the button on the client within 60 seconds to automatically configure security on the client.

After pressing this button for 5 seconds, the **WPS** LED on the front panel flashes. When a client joins the network successfully, the LED remains ON until the next WPS action or the device reboots. If no client joins, the LED stops blinking after 4 minutes.

Rear Panel

The rear panel of your SMCD3GN2 Wireless Cable Modem Gateway contains a reset button and the ports for attaching the supplied power adapter and making additional connections. Figure 2 shows the rear panel components and Table 2 describes their meanings.

![Figure 2. Rear View of your SMCD3GN2 Wireless Cable Modem Gateway](image)

</tr>
</tbody>
</table>
Restoring Factory Defaults

The Reset button on the back panel can be used to return the Gateway to its factory default settings. As a result, any changes made to the Gateway’s default settings will be lost.

If you do not have physical access to the Gateway, you can use the GUI to either power cycle the Gateway (see “Using the Reboot Menu to Reboot the Gateway” on page 99) or return the Gateway to its factory default settings (see “Using the Tools Settings Menu” on page 98).

The following procedure describes how to use the Reset button to power cycle the Gateway and return it to its original factory default settings.

1. Leave power plugged into the Gateway.
2. Find the Reset button on the back panel, then press and hold it for at least 10 seconds.
3. Release the Reset button.
This chapter describes how to install your SMCD3GN2 Wireless Cable Modem Gateway. The topics covered in this chapter are:

- Finding a Suitable Location (page 16)
- Connecting to the LAN (page 16)
- Connecting the WAN (page 17)
- Powering on the Gateway (page 17)
Finding a Suitable Location

The SMCD3GN2 Wireless Cable Modem Gateway can be installed in any location with access to the cable network. All of the cables connect to the rear panel of the Gateway for better organization and utility. The LED indicators on the front panel are easily visible to provide you with information about network activity and status.

For optimum performance, the location you choose should:

- Be close to a working AC power outlet
- Allow sufficient air flow around the Gateway to keep the device as cool as possible
- Not expose the Gateway to a dusty or wet environment
- Be an elevated location such as a high shelf, keeping the number of walls and ceilings between the Gateway and your other devices to a minimum
- Be away from electrical devices that are potential sources of interference, such as ceiling fans, home security systems, microwaves, or the base for a cordless phone
- Be away from any large metal surfaces, such as a solid metal door or aluminum studs. Large expanses of other materials such as glass, insulated walls, fish tanks, mirrors, brick, and concrete can also affect your wireless signal

Connecting to the LAN

Using an Ethernet LAN cable, you can connect the Gateway to a desktop computer, notebook, hub, or switch. Your SMCD3GN2 Wireless supports auto-MDI/MDIX, so you can use either a standard straight-through or crossover Ethernet cable.

1. Connect either end of an Ethernet cable to one of the four ETH ports on the rear panel of the Gateway (see Figure 3).

Figure 3. Connecting to an ETH Port on the Gateway Rear Panel
2. Connect the other end of the cable to your computer’s network-interface card (NIC) or to another network device (see Figure 4).

![Figure 4. Connecting the Gateway to the a Laptop or Desktop Computer](image)

Connecting the WAN

To connect the Gateway to a Wide Area Network (WAN) interface:

1. Connect a coaxial cable to the port labeled *Cable* on the rear panel of the Gateway from a cable port in your home or office (see Figure 2 on page 13). Use only manufactured coaxial patch cables with F-type connectors at both ends for all connections.
2. Hand-tighten the connectors to secure the connection.

Powering on the Gateway

After making your LAN and WAN connections, use the following procedure to power on the Gateway:

1. Connect the supplied power cord to the port on the rear panel of the Gateway (see Figure 2 on page 13).
2. Connect the other end of the power cord to a working power outlet. The Gateway powers on automatically, the **POWER** LED on the front panel goes ON, and the other front panel LEDs show the Gateway’s status (see Table 1 on page 12).

**WARNING:** Only use the power cord supplied with the Gateway. Using a different power cord can damage the Gateway and void the warranty.
3 Configuring Your Computer for TCP/IP

After you install your SMCD3GN2 Wireless Cable Modem Gateway, configure the TCP/IP settings on a computer that will be used to configure the Gateway. This chapter describes how to configure TCP/IP for various Microsoft Windows and Apple Macintosh operating systems.

The topics covered in this chapter are:

- Configuring Microsoft Windows 2000 (page 19)
- Configuring Microsoft Windows XP (page 20)
- Configuring Microsoft Windows Vista (page 21)
- Configuring Microsoft Windows 7 (page 23)
- Configuring an Apple® Macintosh® Computer (page 25)
Configuring Your Computer for TCP/IP

Configuring Microsoft Windows 2000

Use the following procedure to configure your computer if your computer has Microsoft Windows 2000 installed.

1. On the Windows taskbar, click **Start**, point to **Settings**, and then click **Control Panel**.

2. In the Control Panel window, double-click the **Network and Dial-up Connections** icon. If the Ethernet adapter in your computer is installed correctly, the **Local Area Connection** icon appears.

3. Double-click the **Local Area Connection** icon for the Ethernet adapter connected to the Gateway. The Local Area Connection Status dialog box appears (see Figure 5).

4. In the Local Area Connection Status dialog box, click the **Properties** button. The Local Area Connection Properties dialog box appears.

5. In the Local Area Connection Properties dialog box, verify that **Internet Protocol (TCP/IP)** is checked. Then select **Internet Protocol (TCP/IP)** and click the **Properties** button.

6. Click **Obtain an IP address automatically** to configure your computer for DHCP.

7. Click the **OK** button to save this change and close the Local Area Connection Properties dialog box.

8. Click **OK** button again to save these new changes.

9. Restart your computer.
Configuring Your Computer for TCP/IP

Configuring Microsoft Windows XP

Use the following procedure to configure a computer running Microsoft Windows XP with the default interface. If you use the Classic interface, where the icons and menus resemble previous Windows versions, perform the procedure under “Configuring Microsoft Windows 2000” on page 19.

1. On the Windows taskbar, click Start, click Control Panel, and then click Network and Internet Connections.

2. Click the Network Connections icon.

3. Click Local Area Connection for the Ethernet adapter connected to the Gateway. The Local Area Connection Status dialog box appears.

4. In the Local Area Connection Status dialog box, click the Properties button (see Figure 6). The Local Area Connection Properties dialog box appears.

5. In the Local Area Connection Properties dialog box, verify that Internet Protocol (TCP/IP) is checked. Then select Internet Protocol (TCP/IP) and click the Properties button. The Internet Protocol (TCP/IP) Properties dialog box appears.

6. In the Internet Protocol (TCP/IP) Properties dialog box, click Obtain an IP address automatically to configure your computer for DHCP. Click the OK button to save this change and close the Internet Protocol (TCP/IP) Properties dialog box.

7. Click the OK button again to save your changes.

8. Restart your computer.
Configuring Microsoft Windows Vista

Use the following procedure to configure a computer running Microsoft Windows Vista with the default interface. If you use the Classic interface, where the icons and menus resemble previous Windows versions, perform the procedure under “Configuring Microsoft Windows 2000” on page 19.

1. On the Windows taskbar, click Start, click Control Panel, and then select the Network and Internet icon.

2. Click View Networks Status and tasks and then click Management Networks Connections.

3. Right-click the Local Area Connection icon and click Properties.

4. Click Continue. The Local Area Connection Properties dialog box appears.

5. In the Local Area Connection Properties dialog box, verify that Internet Protocol (TCP/IPv4) is checked. Then select Internet Protocol (TCP/IPv4) and click the Properties button (see Figure 7). The Internet Protocol Version 4 Properties dialog box appears.

---

**Figure 7. Local Area Connection Properties Window**
6. In the Internet Protocol Version 4 Properties dialog box, click **Obtain an IP address automatically** to configure your computer for DHCP (see Figure 8).

![Figure 8. Internet Protocol Properties Window](image)

7. Click the **OK** button to save your changes and close the dialog box.

8. Click the **OK** button again to save your changes.

![Figure 9. Local Area Connection Status Window](image)
Configuring Microsoft Windows 7

Use the following procedure to configure a computer running Microsoft Windows 7.

1. In the Start menu search box, type: `ncpa.cpl`

![Figure 10. Typing ncpa.cpl in the Start Menu Box](image)

The Network Connections List appears.

![Figure 11. Example of Network Connections List](image)

2. Right-click the **Local Area Connection** icon and click **Properties**.

3. In the **Networking** tab, click either **Internet Protocol Version 4 (TCP/IPv4)** or **Internet Protocol Version 6 (TCP/IPv6)**, and then click **Properties**.
Figure 12. Local Area Network Connection Properties Dialog Box

4. In the properties dialog box, click **Obtain an IP address automatically** to configure your computer for DHCP (see Figure 13).
5. Click the **OK** button to save your changes and close the dialog box.

6. Click the **OK** button again to save your changes.

**Configuring an Apple® Macintosh® Computer**

The following procedure describes how to configure TCP/IP on an Apple Macintosh running Mac OS 10.2. If your Apple Macintosh is running Mac OS 7.x or later, the steps you perform and the screens you see may differ slightly from the following. However, you should still be able to use this procedure as a guide to configuring your Apple Macintosh for TCP/IP.

1. Pull down the Apple Menu, click **System Preferences**, and select **Network**.
2. Verify that the NIC connected to your SMCD3GN2 is selected in the **Show** field.
3. In the **Configure** field on the **TCP/IP** tab, select **Using DHCP** (see Figure 14).
4. Click **Apply Now** to apply your settings and close the TCP/IP dialog box.
Figure 14. Selecting Using DHCP in the Configure Field
4 Configuring Your Gateway

This chapter describes how to use a Web browser to configure the Gateway.

The topics covered in this chapter are:

- Pre-configuration Guidelines (page 28)
- Accessing the Gateway’s Web Management (page 30)
- Understanding the Web Management Interface Screens (page 31)
- Web Management Interface Menus (page 32)
Pre-configuration Guidelines

Before you configure the Gateway, observe the guidelines in the following sections.

Disabling Proxy Settings

Disable proxy settings in your Web browser. Otherwise, you will not be able to view the Gateway’s Web-based configuration pages.

Disabling Proxy Settings in Internet Explorer

The following procedure describes how to disable proxy settings in Internet Explorer 5 and later.

1. Start Internet Explorer.
2. On your browser’s Tool menu, click Options. The Internet Options dialog box appears.
3. In the Internet Options dialog box, click the Connections tab.
4. In the Connections tab, click the LAN settings button. The Local Area Network (LAN) Settings dialog box appears.
5. In the Local Area Network (LAN) Settings dialog box, uncheck all check boxes.
6. Click OK until the Internet Options window appears.
7. In the Internet Options window, under Temporary Internet Files, click Settings.
8. For the option Check for newer versions of stored pages, select Every time I visit the webpage.
9. Click OK until you close all open browser dialog boxes.

Disabling Proxy Settings in Firefox

The following procedure describes how to disable proxy settings in Firefox.

1. Start Firefox.
2. On your browser’s Tools menu, click Options. The Options dialog box appears.
3. Click the Advanced tab.
4. In the Advanced tab, click the Network tab.
5. Click the Settings button.
6. Click Direct connection to the Internet.
7. Click the OK button to confirm this change.
Disabling Proxy Settings in Safari

The following procedure describes how to disable proxy settings in Safari.

1. Start Safari.
2. Click the Safari menu and select Preferences.
3. Click the Advanced tab.
4. In the Advanced tab, click the Change Settings button.
5. Choose your location from the Location list (this is generally Automatic).
6. Select your connection method. If using a wired connection, select Built-in Ethernet. For wireless, select Airport.
7. Click the Proxies tab.
8. Be sure each proxy in the list is unchecked.
9. Click Apply Now to finish.

Disabling Firewall and Security Software

Disable any firewall or security software that may be running on your computer. For more information, refer to the documentation for your firewall.
Accessing the Gateway’s Web Management

After configuring your computer for TCP/IP and performing the pre-configuration guidelines on the previous page, you can now easily configure the Gateway from the convenient Web-based management interface. From your Web browser (Microsoft Internet Explorer version 5.5 or later), you will log in to the interface to define system parameters, change password settings, view status windows to monitor network conditions, and control the Gateway and its ports.

To access your SMCD3GN2 Wireless Cable Modem Gateway’s web-based management screens, use the following procedure.

1. Launch a Web browser.

   **Note**: The cable modem does not have to be online to configure the Gateway.

2. In the browser address bar, type `http://192.168.0.1` and press the Enter key. For example:

   ![Address](http://192.168.0.1)

   The Login User Password screen appears (see Figure 15)

3. In the Login User Password screen, type the default login username **cusdamin** and the default password **password**. Your service provider may customize the login, so please check with your services provided for correct login information. Both the username and password are case sensitive.

4. Click the **Login** button to access the Gateway. The Status page appears, showing connection status information about the Gateway.
Understanding the Web Management Interface Screens

The left side of the management interface contains a menu bar you use to select menus for configuring the Gateway. When you click a menu, information and any configuration settings associated with the menu appear in the main area of the interface (see Figure 16). If the displayed information exceeds what can be shown in the main area, scroll bars appear to the right of the main area so you can scroll up and down through the information.

Figure 16. Main Areas on the Web Management Interface

Some menus have submenus associated with them. If you click a menu that has submenus, the submenus appear below the menu. For example, if you click the System menu, the submenu Password Settings appears below the System menu (see Figure 17).

Figure 17. Example of System Submenu

The top-right side of the page contains a Home button that displays the Home (Status) page and a Logout button for logging out of the Web management interface.
The bottom right side of the screen contains three buttons:

- **Help** displays online help
- **Apply** click this button to save your configuration changes to the displayed page
- **Cancel** click this button to discard any configuration changes made to the current page

## Web Management Interface Menus and Submenus

Table 3 describes the menus and submenus in the Web management interface.

**Table 3. Web Management Interface Menus and Submenus**

*Note*: Some menus and submenus described in this chapter may not apply to your Gateway. Please check your Gateway’s GUI to see which items are available.

<table>
<thead>
<tr>
<th>Menu and Submenus</th>

### Table 3. Web Management Interface Menus and Submenus

**Note:** Some menus and submenus described in this chapter may not apply to your Gateway. Please check your Gateway’s GUI to see which items are available.

<table>
<thead>
<tr>
<th>Menu and Submenus</th>
<th>Description</th>
<th>See Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAT &gt; Port Forwarding</td>
<td>Configure predefined and custom port forwarding settings to let Internet users access local services such as the Web Server or FTP server at your local site.</td>
<td>67</td>
</tr>
<tr>
<td>Firewall</td>
<td>Lets you enable or disable the Gateway’s firewall. Submenus let you:</td>
<td>73</td>
</tr>
<tr>
<td>Firewall &gt; Access Control</td>
<td>• Block traffic at the Gateway’s LAN interfaces from accessing the Internet.</td>
<td>74</td>
</tr>
<tr>
<td>Firewall &gt; Special Application</td>
<td>• Detect port triggers for detect multiple-session applications and allow them to pass the firewall.</td>
<td>87</td>
</tr>
<tr>
<td>Firewall &gt; URL Blocking</td>
<td>• Block access to certain Web sites from local computers by entering either a full URL address or keywords of the Web site.</td>
<td>90</td>
</tr>
<tr>
<td>Firewall &gt; Schedule Rule</td>
<td>• Define schedule rules that work with the Gateway’s URL blocking feature.</td>
<td>92</td>
</tr>
<tr>
<td>Firewall &gt; Email/Syslog Alert</td>
<td>• Send email notifications or add entries to the syslog when traffic is blocked, attempts are made to intrude onto the network, and local computers try to access block URLs.</td>
<td>93</td>
</tr>
<tr>
<td>Firewall &gt; DMZ</td>
<td>• Configure a local client computer for unrestricted two-way Internet access by defining it as a Virtual DMZ host.</td>
<td>97</td>
</tr>
<tr>
<td>Tools</td>
<td>Lets you reset the Gateway and return it to its factory default settings. The submenu lets you:</td>
<td>98</td>
</tr>
<tr>
<td>Tools &gt; Reboot</td>
<td>• Reboot the Gateway while keeping all overrides you made to the device’s factory default settings.</td>
<td>99</td>
</tr>
<tr>
<td>Status</td>
<td>Shows the connection status of the Gateway interfaces, firmware, hardware version numbers, illegal attempts to access your network, and information about DHCP client PCs current connected to the Gateway. The submenu lets you:</td>
<td>100</td>
</tr>
<tr>
<td>Status &gt; Cable Status</td>
<td>• View cable initialization procedures, and cable downstream and upstream status.</td>
<td>101</td>
</tr>
</tbody>
</table>
System Settings Menu

The System Settings menu lets you enable or disable Universal Plug and Play (uPnP) and Home Network Administration Protocol (HNAP). To access the System Settings menu, click System in the menu bar. Figure 18 shows an example of the menu and Table 4 describes the setting you can select.

![Figure 18. System Settings Menu](image)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable UPnP| Configures your Gateway as a uPnP Internet gateway. UPnP allows for dynamic connectivity between devices on a network. A UPnP-enabled device like your Gateway can obtain an IP address, advertise its capabilities, learn about other connected UPnP devices and then communicate directly with those devices. The same device can end its connection cleanly when it wishes to leave the UPnP community. The intent of UPnP is to support zero-configuration, "invisible" networking of devices including intelligent appliances, PCs, printers, and other smart devices using standard protocols.  
  - Check = uPnP is enabled on the Gateway. (default)  
  - Uncheck = uPnP is disabled on the Gateway. |
| Enable HNAP| Configures your Gateway as a HNAP device. HNAP allows your Gateway to be configured and managed by remote entities, such as Network Magic or any software application that discovers and manages network devices.  
  - Check = HNAP is enabled on the Gateway. (default)  
  - Uncheck = HNAP is disabled on the Gateway. |
Password Settings Menu

The Password Settings menu lets you change the default username and password used to log in to the Gateway’s Web interface.

The Password Settings menu also lets you change the number of minutes of inactivity that can occur before your Web management session times out automatically. The default setting is 10 minutes.

To access the Password Settings menu, click **System** in the menu bar and then click the **Password Settings** submenu. Figure 19 shows an example of the menu and Table 5 describes the settings you can select.

![Password Settings Menu](image)

<td>Enter the current case-sensitive login password. For security purposes, every typed character appears as a dot (•). The default password is not shown for security purposes.</td>
</tr>
<tr>
<td>New Password</td>
<td>Enter the new case-sensitive login password you want to use. A password can contain up to 32 alphanumeric characters. Spaces count as password characters. For security purposes, every typed character appears as a dot (•).</td>
</tr>
<tr>
<td>Re-Enter Password for Verification</td>
<td>Enter the same case-sensitive login password you typed in the New Password field. For security purposes, every typed character appears as a dot (•).</td>
</tr>
<tr>
<td>Idle Time Out</td>
<td>Your Web management interface sessions timeout after 10 minutes of idle time. To change this duration, enter a new timeout value.</td>
</tr>
</tbody>
</table>

### LAN Settings Menu

IP addresses are close to being used up and thus very hard to get. One solution to this problem is "private" IP addresses. Private IP addresses are ranges of IP addresses set aside expressly for use by a company or other entity internally. Private IP addresses are non-routable and, therefore, cannot be used to connect directly to the Internet.

Some of the advantages of private IP addresses include:

- Increased security, since private IP addresses are not routable across the Internet
- You conserve the world-wide pool of IP addresses
- You do not have to register or pay for these IP addresses in any way

Using the LAN Settings menu, you can define private LAN IP addresses. To access the LAN Settings menu, click LAN in the menu bar. Figure 20 shows an example of the menu and Table 6 describes the settings you can select.

</tbody>
</table>
Ether Switch Port Control Menu

By default, the Gateway LAN ports are enabled to auto-negotiate the highest supported speed and appropriate duplex mode. If these settings prevent the Gateway from successfully connecting with other devices, you can use the Ether Switch Port Control menu to configure the Gateway to use fixed speed and duplex settings. The Ether Switch Port Control menu also let you disable the individual LAN ports. For your convenience, each port can be configured independently of the other LAN ports on the Gateway.

To access the Ether Switch Control menu, click LAN in the menu bar and then click the Ether Switch Control submenu in the menu bar. Figure 21 shows an example of the menu.

![Ether Switch Port Control Menu](image)

Figure 21. Ether Switch Port Control Menu
The following procedure describes how to change the settings in the Ether Switch Port Control menu.

1. To change a port from auto-negotiation to a fixed speed and duplex setting:
   a. Uncheck the Auto check box for the port.
   b. Under Speed (10/100/1000), click the radio that corresponds to the fixed speed you want to use for that port.
   c. Under the Mode H/F column, leave the check mark for full-duplex mode or uncheck it for half-duplex mode.

2. To disable a port, regardless of the auto-negotiation and duplex settings, uncheck Enable for the port.

3. Click Apply.
LAN Access Control Menu

Using the LAN Access Control menu, you can:

- Allow all EtherLAN client stations to access the Internet through the Gateway. This is the default setting.
- Allow certain trusted EtherLAN client stations to access the Internet through the Gateway. You use the add up to 16 trusted clients.
- Deny certain trusted EtherLAN client stations from accessing the Internet through the Gateway. You use the add up to 16 untrusted clients.

To access the LAN Access Control menu, click LAN in the menu bar and then click the Ether Access Control submenu in the menu bar. Figure 22 shows an example of the menu.

![LAN Access Control Menu](image)

Figure 22. LAN Access Control Menu
Controlling LAN Access

By default, **All EtherLAN LAN stations** is selected at the top of the menu. This setting allows all client stations to access the Internet through the Gateway. To restrict LAN access, click one of the following radio buttons and click **Apply**:

- **Trusted PC List** = restricts Internet access through the Gateway to client stations in the Lan Trusted Table. To add client station to this table, see “Adding and Deleting Trusted Client Stations”, below.

- **Untrusted PC List** = prevents client stations in the Lan Untrusted Table from accessing the Internet through the Gateway. To add client stations to this table, see “Adding and Deleting Untrusted Client Stations” on page 43.

Adding and Deleting Trusted Client Stations

To restrict Internet access through the Gateway to certain trusted EtherLAN client stations, define the client stations as trusted clients. Using this procedure you can define up to 16 trusted client stations.

1. Click **Trusted PC list** at the top of the menu.

2. To add client stations that the Gateway automatically learned on the network, perform the following steps under **Auto-Learned Lan Devices**:
   a. Click a client station that the Gateway learned automatically.
   b. Under **Trusted?**, click **Y**.
   c. Click **Add**. The client station is added to the **Lan Trusted Table**.
   d. To add more auto-learned client stations (up to 16), repeat steps 2a through 2c.

3. To manually add trusted client stations, perform the following steps under **Manually-Added Lan Devices**:
   a. Under **Device Name**, enter a name for the device.
   b. Under **MAC Address**, enter the MAC address of the device.
   c. Under **Trusted?**, click **Y**.
   d. Click **Add** to add the client station to the **Lan Trusted Table**.
   e. To manually add more client stations (up to 16), repeat steps 3a through 3d.
4. To delete client stations from the Lan Trusted Table, click the radio button corresponding to the client station you want to delete and click the Delete button. A precautionary message does not appear before deleting a client station.

5. To enforce this policy, click Trusted PC list at the top of the menu.

6. When you finish, click Apply.

**Adding and Deleting Untrusted Client Stations**

To prevent certain trusted EtherLAN client stations from accessing the Internet through the Gateway, define the client stations as untrusted clients. Using this procedure you can define up to 16 untrusted client stations.

1. Click Untrusted PC list at the top of the menu.

2. To add client stations that the Gateway automatically learned on the network, perform the following steps under Auto-Learned Lan Devices:
   a. Click a client station that the Gateway learned automatically.
   b. Under Trusted?, click N.
   c. Click Add to add the client station to the Lan Untrusted Table.
   d. To add more auto-learned client stations, repeat steps 2a through 2c.

3. To manually add client stations, perform the following steps under Manually-Added Lan Devices:
   a. Under Device Name, enter the name of the device.
   b. Under MAC Address, enter the MAC address of the device.
   c. Under Trusted?, click N.
   d. Click Add to add the client station to the Lan Untrusted Table.
   e. To add more client stations manually, repeat steps 3a through 3d.

4. To delete client stations from the untrusted list, in the Lan Untrusted Table, click the radio button corresponding to the client station you want to delete and click the Delete button. A precautionary message does not appear before deleting an untrusted client station.

5. To enforce this policy, click Untrusted PC list at the top of the menu.

6. When you finish, click Apply.
QoS Settings Menu

Quality of Service (QoS) refers to a collection of techniques for identifying data whose delivery across the network is time sensitive, and managing its delivery through both bandwidth allocation and prioritization schemes.

Using the QoS Settings menu, you can enable the Gateway’s QoS module to provide guarantees on the ability of the network to deliver predictable results. To access the QoS menu, click QOS in the menu bar. Figure 23 shows an example of the menu.

By default, QoS is enabled. To disable the Gateway’s QoS module, uncheck Enable QOS Module and click Apply. To disable the Gateway’s QoS module, uncheck Enable QOS Module and click Apply.

When the Gateway’s QoS module is enabled, the following submenus appear under QOS in the menu bar:

- **Port** - lets you configure the priority queue to which the switch port is mapped. See page 45.
- **COS** - lets you define four queues to which the CoS is mapped. See page 46.
- **DSCP** - lets you define the QoS class queue to which the customized DSCP is mapped. See page 48.
- **Queue** - lets you specify whether QoS behavior runs with strict or weighted priority. See page 50.
- **DSCP Remark** - lets you define the DSCP remarking action and mode. See page 52.

![Figure 23. QoS Settings Menu](image-url)
Port Based QoS Menu

The Port Based QoS menu lets you enable or disable the Gateway’s port-based QoS setting. To access the Port Based QoS menu, click QOS in the menu bar and then click the Port submenu in the menu bar. Figure 24 shows an example of the menu.

- To enable the Gateway’s port-based QoS setting, check Enable Port Based QoS and click Apply.
- To disable the Gateway’s port-based QoS setting, uncheck Enable Port Based QoS and click Apply.

Note: The Port submenu is not available in the menu bar if Enable QOS Module is not checked in the QoS Settings menu (see page 39).

![Figure 24. Port Based QoS Menu](image-url)
### CoS Settings Menu

Given that there will always be points in the network where multiple traffic streams merge or where network links will change speed and capacity, it is important to move traffic on the basis of relative importance. Without CoS prioritization, less important traffic can consume network bandwidth and slow down or halt the delivery of more important traffic. For example, without CoS, most traffic received by the Gateway is forwarded with the same priority it had upon entering the Gateway. In many cases, such traffic is “normal” priority and competes for bandwidth with all other normal-priority traffic, regardless of its relative importance to your requirements. CoS helps to keep the most important network traffic moving at an acceptable speed, regardless of current bandwidth usage. This means you can manage available bandwidth so that the switch transmits the most important traffic first.

The CoS Settings menu lets you configure a CoS priority of 0 through 7 for an outbound packet. When the packet is then sent to a port, the CoS priority determines which outbound queue the packet uses. After configuring CoS priority for outbound packets, use this menu to map the classes of service to the Gateway’s four ports.

To access the CoS Settings menu, click QOS in the menu bar and then click the CoS submenu in the menu bar. Figure 25 shows an example of the menu.

**Note:** The **COS** submenu is not available in the menu bar if **Enable QOS Module** is not checked in the QoS Settings menu (see page 39).

![Figure 25. CoS Settings Menu](image-url)
To define CoS settings:

1. Check **Enable QoS Class based on CoS**.

2. For each class of service, assign a queue number from 0 to 3. Higher priority values are evaluated as being of higher importance than lower priority values.

3. Under **Port Default CoS**, map the Gateway’s four ports to the classes of service you defined in the previous step.
   
   – CoS setting from 0 to 3 = normal priority. Packets in this queue leave the port after the high-priority queue is emptied.
   
   – CoS setting from 4 to 7 = high priority. Packets in this queue leave the port first.

4. Click **Apply**.
DSCP Based QoS Menu

The DSCP Based QoS menu lets you classify and prioritize traffic using DSCP tags. DSCP allows the Gateway to determine how traffic classes should be prioritized. Using the DSCP Based QoS menu, you can use DSCP to provide different levels of service to conforming and non-conforming traffic by appropriately selecting the DSCP values in this menu. The Gateway uses the Hierarchical Token Bucket queuing algorithm, which divides the 64 possible DSCP code values into 8 queues.

Table 7 shows the actual queuing.

<table>
<thead>
<tr>
<th>Name</th>
<th>Precedence</th>
<th>DSCP Range</th>
<th>Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>Routing (default)</td>
<td>000 (0)</td>
<td>000000(0) – 000111 (7)</td>
<td>8</td>
</tr>
<tr>
<td>Priority</td>
<td>001 (1)</td>
<td>001000 (8) – 001111 (15)</td>
<td>7</td>
</tr>
<tr>
<td>Immediate</td>
<td>010 (2)</td>
<td>010000 (16) – 010111 (23)</td>
<td>6</td>
</tr>
<tr>

<td>101000 (40) – 101111 (47)</td>
<td>3</td>
</tr>
<tr>
<td>Internetwork Control</td>
<td>110 (6)</td>
<td>110000 (48) – 110111 (55)</td>
<td>2</td>
</tr>
<tr>
<td>Network Control</td>
<td>111 (7)</td>
<td>111000 (56) – 111111 (63)</td>
<td>1</td>
</tr>
</tbody>
</table>

To access the DSCP Based QoS menu, click QOS in the menu bar and then click the DSCP submenu in the menu bar. Figure 26 shows an example of the menu.

Note: The DSCP submenu is not available in the menu bar if Enable QOS Module is not checked in the QoS Settings menu (see page 39).
To define DSCP-based QoS settings:

1. Check **Enable DHCP Based QoS**.
2. For each index, enter a DSCP value from 0 to 63.
3. Under **Queue**, select a queue (from 0 to 3) you want to map to this DSCP value. Higher priority values are evaluated as being of higher importance than lower priority values.
4. To define DSCP-based QoS values for other queues, repeat steps 2 and 3.
5. Click **Apply**.
Queue Settings Menu

The Queue Settings menu lets you configure QoS behavior as either strict priority or weighted priority.

- **Strict priority** – allows delay-sensitive data such as voice to be sent before packets in other queues.
- **Weighted priority** – lets you assign each queue with a certain weight indicating the amount of guaranteed capacity, with high priority packets served before any low priority packets.

To access the Queue Settings menu, click **QOS** in the menu bar and then click the **Queue** submenu in the menu bar. Figure 27 shows an example of the menu.

**Note:** The **Queue** submenu is not available in the menu bar if **Enable QOS Module** is not checked in the QoS Settings menu (see page 39).
By default, the Gateway uses strict priority. To change to weighted priority:

1. For **Queue Type**, select **Weighted Priority**. The options in Figure 28 appear.

![Figure 28. Weighted Priority Options](image)

2. For **Weight Base**, select a queue weight to ensure that some sets of queues get higher thresholds than others. Queue weight directs the Gateway to set the queue thresholds proportionately. Choices are 8 or 10. Queues with a weight of 10 are longer than those with a queue weight of 8.

3. For each Gateway queue, enter a weight. Each weight corresponds to a percentage of consumed bandwidth, as shown in the **% of Bandwidth** column.

4. When you finish, click **Apply**.
DSCP Remarking Menu

The DSCP Remarking menu lets you configure the Gateway’s DSCP remarking mode and actions.

To access the Queue Settings menu, click QOS in the menu bar and then click the DSCP Remarking submenu in the menu bar. Figure 29 shows an example of the menu.

Note: The DSCP Remarking submenu is not available in the menu bar if Enable QOS Module is not checked in the QoS Settings menu (see page 39).

![Figure 29. DSCP Remarking Menu](image)

To configure DSCP remarking settings:

1. Check Enable DSCP Remarking.
2. Complete the options in the menu and refer to Table 8.
3. When you finish, click Apply.
### Table 8. DSCP Remarking Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dscp remarking mode</td>
<td>Lets you select the DSCP remarking mode that the Gateway is to use. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• Map frame priority to AF code points = select this option for Quality of Service configurations that use assured forwarding (AF) code points to mark packets. AF guarantees a certain amount of bandwidth to an AF class and allows access to extra bandwidth, if available. <strong>(default)</strong></td>
</tr>
<tr>
<td></td>
<td>• Map frame priority to CS code points = select this option for Quality of Service configurations that use class selector (CS) code points to mark packets. CS provides code points that can be used for backward compatibility with IP Precedence. IP Precedence is a legacy technology that the Gateway supports for backwards compatibility.</td>
</tr>
<tr>
<td>Request a remarking action when DSCP equals one of the following CPs</td>
<td></td>
</tr>
<tr>
<td>Expedited Forwarding Code Point</td>
<td>Expedited forwarding provides a low-loss, low-latency, low-jitter, and assured bandwidth service. Applications such as VoIP, video, and other time sensitive applications require a robust network treatment like expedited forwarding. When checked, the Gateway requests a remarking action if DSCP equals an expedited forwarding code point. By default, this option is not checked.</td>
</tr>
<tr>
<td>Assured Forwarding Code Points</td>
<td>Assured forwarding defines a method by which packets can be given different forwarding assurances. Traffic can be divided into different classes and then each class given a certain percentage of bandwidth. For example, one class could have 50% of the available link bandwidth, another class could have 30%, and another 20% of the bandwidth. When checked, the Gateway requests a remarking action if DSCP equals an assured forwarding code point. By default, this option is not checked.</td>
</tr>
<tr>
<td>Class Selector Code Points</td>
<td>Class Selector code points are code points that can be used for backward compatibility with IP Precedence models. When checked, lets the Gateway request a remarking action if DSCP equals a class selector code point. By default, this option is checked, but does not take effect until the OSPF Status changes to ENABLE.</td>
</tr>
<tr>
<td>Zero</td>
<td>When checked, lets the Gateway request a remarking action if DSCP equals zero. By default, this option is checked, but does not take effect until the OSPF Status changes to ENABLE.</td>
</tr>
<tr>
<td>Others</td>
<td>When checked, lets the Gateway request a remarking action if DSCP equals a non-zero value. By default, this option is checked, but does not take effect until the OSPF Status changes to ENABLE.</td>
</tr>
</tbody>
</table>
Wireless Basic Settings Menu

The Wireless Basic Settings menu lets you configure basic wireless settings, such as:

- Enabling or disabling the Gateway's wireless operation
- Selecting a wireless mode
- Configuring the primary SSID
- Configuring channel settings

To access the Wireless Basic Settings menu, click Wireless in the menu bar. Figure 30 shows an example of the menu and Table 9 describes the settings you can select.

Figure 30. Wireless Basic Settings Menu
### Table 9. Wireless Basic Settings Menu Options

<tr>
<td></td>
<td>• Hidden = when checked, hides the SSID. Use this setting to block illegal connections. Users cannot reconnect automatically or manually to a wireless network that uses a hidden SSID. The wireless network that uses a hidden SSID does not appear in the Microsoft Windows Wireless Network Connection window.</td>
</tr>
<tr>
<td></td>
<td>• In-service = when checked, broadcasts the Gateway’s SSID.</td>
</tr>
<tr>
<td></td>
<td>• WMM Mode = when checked, enables WMM. Enabling WMM can help control latency and jitter when transmitting multimedia content over a wireless connection.</td>
</tr>
<tr>
<td>Channel</td>
<td>Select the appropriate channel from the list provided to correspond with your network settings, between 1 and 11 (in North America). Default is Auto, which selects the appropriate channel automatically. All devices in your wireless network must use the same channel to work properly.</td>
</tr>
</tbody>
</table>
Wireless Encryption Settings Menu

Using the Wireless Encryption Settings menu, you can protect the data transmitted across your wireless network. The same encryption keys you specify here must also be configured on your other wireless client devices on your wireless network.

To access the Wireless Encryption Settings menu, click Wireless in the menu bar and then click the Encryption submenu. Figure 31 shows an example of the menu and Table 10 describes the settings you can select.

Note: The Encryption submenu is not available in the menu bar if wireless operation is disabled in the Wireless Basic Settings menu (see page 54).

<td><strong>Pre-Authentication</strong></td>
<td>Enables secure fast roaming, without noticeable signal latency. By default, this option is disabled.</td>
</tr>
</tbody>
</table>
WPS Setup

Using the WPS Setup menu, you can enable or disable WPS. WPS is a standard for easy and secure wireless network set up and connections.

The advantages of WPS are:

- WPS automatically configures the network name (SSID) and WPA security key for the Gateway and for the access point and wireless devices that join the network.
- You do not need to know the network name and security keys or passphrases to use WPS to join a wireless network.
- No one can guess your security keys or passphrase because they are generated randomly.
- WPS uses the Extensible Authentication Protocol (EAP), which is a strong authentication protocol used in WPA2.

The disadvantages of WPS are:

- Unless all the Wi-Fi devices on the network are WPS-compatible, you cannot take advantage of the ease of securing the network.
- Not all wireless equipment supports WPS.
- If your wireless devices do not support WPS, it can be hard to join a network that was set up with WPS because the wireless network name and security key are random sequences of letters and numbers.

To access the WPS Setup menu, click **Wireless** in the menu bar and then click the **WPS** submenu. Figure 34 shows an example of the menu. Using the **WPS Config** drop-down list, select the appropriate option to enable or disable WPS setup.
By default, WPS is disabled. If you select **ENABLE** and click **Apply**, the options in Figure 35 are displayed. Table 13 describes the options shown.

</tr>
</tbody>
</table>
MAC Filtering

Using the MAC Filtering menu, you can define up to 16 MAC address filters to prevent PCs from sending outgoing TCP/UDP traffic to the WAN via their MAC addresses. This is useful because a specific NIC’s MAC address never changes, unlike its IP address, which can be assigned by a DHCP server or hard-coded to various addresses over time.

The MAC Filtering menu allows wireless client stations to connect over a wireless connection in two ways:

- By allowing all wireless station access.
- By allowing only trusted PCs.

To access the MAC Filtering menu, click Wireless in the menu bar and then click the MAC Filtering submenu. Figure 36 shows an example of the menu and Table 14 describes the settings you can select.

Note: The MAC Filtering submenu is not available in the menu bar if wireless operation is disabled in the Wireless Basic Settings menu (see page 54).

</tr>
</tbody>
</table>

Adding and Deleting Wireless Client Stations

To allow wireless client stations to access the Internet through the Gateway, use the following procedure to define up to 16 wireless client stations.

1. To add wireless client stations that the Gateway automatically learned on the network, perform the following steps under **Auto-Learned Lan Devices**:
   a. Click a wireless client station that the Gateway learned automatically.
   b. Click **Add**. The wireless client station is added to the **Wireless Control List**.
   c. To add more auto-learned wireless client stations (up to 16), repeat steps 1a and 1b.

2. To manually add wireless client stations, perform the following steps under **Manually-Added Wireless Devices**:
   a. Under **Device Name**, enter a unique name for the device (that is, a name that does not already appear in the **Wireless Control List**).
   b. Under **MAC Address**, enter the MAC address of the device.
   c. Click **Add** to add the wireless client station to the **Wireless Control List**.
   d. To manually add more wireless client stations (up to 16), repeat steps 2a through 2c.

3. To delete wireless client stations from the **Wireless Control List**, click the radio button corresponding to the wireless client station you want to delete and click the **Delete** button. A precautionary message does not appear before deleting a wireless client station.

4. When you finish, click **Apply**.
Advanced Wireless Settings Menu

Using the Advanced Wireless Settings menu, you can configure advanced wireless settings for the Gateway.

To access the Advanced Wireless Settings menu, click Wireless in the menu bar and then click the Advanced Wireless Settings submenu. Figure 37 shows an example of the menu and Table 15 describes the settings you can select.

Note: The Advanced Wireless Settings submenu is not available in the menu bar if wireless operation is disabled in the Wireless Basic Settings menu (see page 54).

</table>
Port Forwarding Menu

The Port Forwarding menu lets you configure the Gateway to provide port-forwarding services that let Internet users access predefined services such as HTTP (80), FTP (20/21), and AIM/ICQ (5190) as well as custom-defined services. You perform port forwarding by redirecting the WAN IP address and the service port to the local IP address and service port. You can configure a maximum of 100 predefined and custom-defined services.

To access the Port Forwarding menu, click NAT in the menu bar and then click the Port Forwarding submenu in the menu bar. Figure 38 shows an example of the menu.

![Port Forwarding Menu](image)

Figure 38. Port Forwarding Menu
Adding Predefined Services

Using the following procedure, you can select well-known services and specify the LAN host IP address(es) that will provide the service to the Internet.

1. In the Port Forwarding menu, uncheck Disable Port Forwarding Function if it is checked.

2. Click the Add button below the Predefined Service Table. The Predefined Service menu appears (see Figure 39).

3. Complete the fields in the Predefined Service menu (see Table 16).

4. Click Apply. (Or click Back to return to the Port Forwarding menu or Cancel to cancel any selections you made.) If you clicked Apply, the predefined service is added to the Predefined Service Table.

5. To configure additional predefined services (up to 100, including customer-defined services), repeat steps 2 through 4.

6. To change the settings for a predefined service, click the radio button to the left of the service you want to change and click the Edit button. When the Predefined Service menu appears, edit the settings as necessary (see Table 16) and click Apply.

7. To delete a predefined service, click the radio button to the left of the service you want to delete and click the Delete button. No precautionary message appears before you delete a predefined service.

<tr>
<td>End IP</td>
<td>Enter the ending IP address in the remote IP address range. This field is unavailable if the Gateway is configured for any remote IP addresses or for a single remote IP address.</td>
</tr>
</tbody>
</table>
Adding Customer-Defined Services

Using the following procedure, you can define special application services you want to provide to the Internet. The following example shows how to set port forwarding for a Web server on an Internet connection, where port 80 is blocked from the WAN side, but port 8000 is available.

Name: Web Server  
Type: TCP  
LAN Server IP: 192.168.0.100  
Remote IPs: Any (allow access to any public IP)  
Public Port: 8000  
Private Port: 80

With this configuration, all HTTP (Web) TCP traffic on port 8000 from any IP address on the WAN side is redirected through the firewall to the Internal Server with the IP address 192.168.0.100 on port 80.

To create your own customized services:

1. In the Port Forwarding menu, uncheck **Disable Port Forwarding Function** if it is checked.
2. Click the **Add** button below the **Customer Defined Service Table**. The Customer Defined Service menu appears (see Figure 40).
3. Complete the fields in the Customer Defined Service menu (see Table 17).
4. Click **Apply**. (Or click **Back** to return to the Port Forwarding menu or **Cancel** to cancel any selections you made.) If you clicked **Apply**, the customer-defined service is added to the **Customer Defined Service Table**.
5. To configure additional customer-defined services (up to 100, including predefined services), repeat steps 2 through 4.
6. To change the settings for a customer-defined service, click the radio button to the left of the service you want to change and click the **Edit** button. When the Customer Defined Service menu appears, edit the settings as necessary (see Table 17) and click **Apply**.
7. To delete a customer-defined service, click the radio button to the left of the service you want to delete and click the **Delete** button. No precautionary message appears before you delete a customized service.

<tr>
<td>Private Ports</td>
<td>Numbers of the ports whose traffic the Gateway forwards to the LAN. If there is a range of ports, enter the starting private port here and check <strong>Enable Port Range</strong>. The Gateway automatically calculates the end private port. The LAN PC server listens for traffic/data on this port (or these ports).</td>
</tr>
</tbody>
</table>
Security Settings (Firewall) Menu

The Security Settings (Firewall) menu lets you enable or disable the Gateway’s firewall. If you enable the Gateway firewall module, the following submenus appear in the menu bar:

- Configure access control settings — see page 74
- Configure the Gateway for special applications — see page 76
- Set up URL blocking — see page 90
- Schedule rules — see page 92
- Receive email or syslog alert notifications — see page 93
- Configure a local client computer as a local DMZ for unrestricted two-way Internet access — see page 97

Enabling or Disabling Firewall

The Security Settings (Firewall) menu provides an option for enabling or disabling the Gateway’s firewall setting. To access the Security Settings (Firewall) menu, click **Firewall** in the menu bar. Figure 41 shows an example of the menu.

By default, the Gateway’s firewall settings are enabled. To disable the firewall, uncheck **Enable Firewall Module** and click **Apply**. Disabling the firewall hides the submenus below the **Firewall** menu.

![Figure 41. Security Settings (Firewall) Menu](image)
Configuring Access Control

The Access Control menu lets you enable access control to block traffic at the Gateway's LAN interfaces from accessing the Internet.

To access the Access Control menu, click **Firewall** in the menu bar and then click the **Access Control** submenu in the menu bar.

**Note:** The **Access Control** submenu is not available in the menu bar if **Enable Firewall Module** is disabled in the Security Settings (Firewall) menu (see page 73).

By default, the Gateway does not block attempts to access the LAN from the Internet. To enable access control, check **Enable Access Control** if it is unchecked and click **Apply**. When Access Control is enabled, you can configure up to 35 predefined and customer-defined filtering tables.
Figure 42. Access Control Menu
Adding Predefined Access Rules

Using the following procedure, you can select a well-known service and specify whether to block all LAN hosts, a single LAN host, or a range of LAN hosts.

1. In the Access Control menu, check Enable Access Control if it is not checked and click the Apply button. The remaining fields in the menu become available.

2. Under Predefined Service Table, click the Add button. The Predefined Access Rules menu appears (see Figure 43).

3. Complete the fields in the Predefined Access Rules menu (see Table 18).

4. Click Apply. (Or click Back to return to the Access Control menu or Cancel to cancel any selections you made.) If you clicked Apply, the rule for the predefined access rule is added to the Predefined Service Table.

5. To configure additional access control rules for predefined services (up to 35, including access rules for customer-defined services), repeat steps 2 through 4. When you finish, click Apply in the Access Control menu to save your settings.

6. To change the rule for a predefined rule, click the radio button to the left of the rule you want to change and click the Edit button. When the Predefined Access Rules menu appears, edit the settings as necessary (see Table 18) and click Apply. Click Apply in the Access Control menu to save your settings.

7. To delete a predefined rule, click the radio button to the left of the rule you want to delete and click the Delete button. No precautionary message appears before you delete a rule. Click Apply in the Access Control menu to save your settings.

</table>
Adding Customer-Defined Access Rules

Using the following procedure, you can define your own rules regarding the type of traffic allowed from the Internet to the public LAN site.

1. In the Access Control menu, check Enable Access Control if it is not checked and click the Apply button. The remaining fields in the menu become available.

2. Under Customer Defined Service Table, click the Add button. The Customer Defined Access Rules menu appears (see Figure 44).

3. Complete the fields in the Customer Defined Access Rules menu (see Table 19).

4. Click Apply. (Or click Back to return to the Access Control menu or Cancel to cancel any selections you made.) If you clicked Apply, the rule for the customer-defined rule is added to the Customer Defined Service Table.

5. To configure additional access control rules for customer-defined services (up to 35, including access rules for predefined services), repeat steps 2 through 4. When you finish, click Apply in the Access Control menu to save your settings.

6. To change the rule for a customer-defined service, click the radio button to the left of the rule you want to change and click the Edit button. When the Customer-Defined Access Rules menu appears, edit the settings as necessary (see Table 19) and click Apply. Click Apply in the Access Control menu to save your settings.

7. To delete a customer-defined rule, click the radio button to the left of the rule you want to delete and click the Delete button. No precautionary message appears before you delete a rule. Click Apply in the Access Control menu to save your settings.

</tbody>
</table>
Adding Predefined Filters

Using the following procedure, you can add predefined filters that block certain types of traffic from the LAN side of the Gateway to the Internet side of the Gateway.

1. In the Access Control menu, check Enable Access Control if it is not checked and click the Apply button. The remaining fields in the menu become available.

2. Under Predefined Filtering Table, click the Add button. The Predefined Filter menu appears (see Figure 45).

3. Complete the fields in the Predefined Filter menu (see Table 20).

4. Click Apply. (Or click Back to return to the Access Control menu or Cancel to cancel any selections you made.) If you clicked Apply, the predefined filter is added to the Predefined Filtering Table.

5. To define additional filters for access control (up to 35, including customer-defined filters), repeat steps 2 through 4. When you finish, click Apply in the Access Control menu to save your settings.

6. To change the settings for a predefined filter, click the radio button to the left of the service you want to change and click the Edit button. When the Predefined Filter menu appears, edit the settings as necessary (see Table 20) and click Apply. Click Apply in the Access Control menu to save your settings.

7. To delete a predefined filter, click the radio button to the left of the filter you want to delete and click the Delete button. No precautionary message appears before you delete a predefined filter. Click Apply in the Access Control menu to save your settings.

Adding Customer-Defined Filters

Using the following procedure, you can add customer-defined filters that block certain types of traffic from the LAN side of the Gateway to the Internet side of the Gateway.

1. In the Access Control menu, check **Enable Access Control** if it is not checked and click the **Apply** button. The remaining fields in the menu become available.

2. Under **Customer Defined Filtering Table**, click the **Add** button. The Customer Defined Filter menu appears (see Figure 46).

3. Complete the fields in the Customer Defined Filter menu (see Table 21).

4. Click **Apply**. (Or click **Back** to return to the Access Control menu or **Cancel** to cancel any selections you made.) If you clicked **Apply**, the customer-defined filter is added to the **Customer Defined Filtering Table**.

5. To define additional filters for access control (up to 35, including predefined filters), repeat steps 2 through 4. When you finish, click **Apply** in the Access Control menu to save your settings.

6. To change the settings for a customer-defined filter, click the radio button to the left of the filter you want to change and click the **Edit** button. When the Customer Defined Filter menu appears, edit the settings as necessary (see Table 21) and click **Apply**. Click **Apply** in the Access Control menu to save your settings.

7. To delete a customer-defined filter, click the radio button to the left of the filter you want to delete and click the **Delete** button. No precautionary message appears before you delete a customer-defined filter. Click **Apply** in the Access Control menu to save your settings.

</tbody>
</table>
Configuring Special Applications

Using the Special Application menu, you can configure the Gateway to detect port triggers for detect multiple-session applications and allow them to pass the firewall. For special applications, besides the initial communication session, there are multiple related sessions created during the protocol communications. Normally, a normal treats the triggered sessions as independent sessions and blocks them. However, the Gateway can co-relate the triggered sessions with the initial session and group them together in the NAT session table. As a result, you need only specify which protocol type and port number you want to track, as well as some other related parameters. In this way, the Gateway can pass the special applications according to the supplied information.

Assume, for example, that to use H.323 in a Net Meeting application, a local client starts a session A to a remote host. The remote host uses session A to communicate with the local host, but it also could initiate another session B back to the local host. Since there is only session A recorded in the NAT session table when the local host starts the communication, session B is treated as an illegal access from the outside and is blocked. Using the Special Application menu, you can configure the Gateway to co-relate sessions A and B and automatically open the port for the incoming session B.

To display the Special Applications menu, click Firewall in the menu bar and then click the Special Application submenu. Figure 47 shows an example of the menu.

The maximum number of allowed triggers is 20. To enable the special application function, check the Enable Triggering checkbox and click Apply. To disable it, uncheck the Enable Triggering checkbox and click Apply.

**Note:** The Special Application submenu is not available in the menu bar if Enable Firewall Module is disabled in the Security Settings (Firewall) menu (see page 73).
To enable port triggering:

1. In the Special Application menu, check **Enable Triggering** if it is unchecked and click the **Apply** button. The Trigger Table becomes available.

2. Click the **Add** button below **Trigger Table**. The Trigger menu appears (see Figure 48).

3. Complete the fields in fields Trigger menu (see Table 22).

4. Click **Apply**. (Or click **Back** to return to the Trigger menu or **Cancel** to cancel any selections you made.) If you clicked **Apply**, the trigger is added to the **Trigger Table**.

5. To configure additional triggers (up to 20), repeat steps 1 through 4. When you finish, click **Apply** in the Special Applications menu to save your settings.

6. To change the settings for a trigger, click the radio button to the left of the trigger you want to change and click the **Edit** button. When the Trigger menu appears, edit the settings as necessary (see Table 22) and click **Apply**. Click **Apply** in the Special Application menu to save your settings.

7. To delete a trigger, click the radio button to the left of the trigger you want to delete and click the **Delete** button. No precautionary message appears before you delete a trigger. Click **Apply** in the Special Application menu to save your settings.
Figure 48. Trigger Menu

Table 22. Trigger Menu Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for identifying the trigger. The name is for reference purposes only.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of protocol you want to use with the trigger. Choices are TCP and UDP. Default is TCP. For example, to track the H.323 protocol, the protocol type should be TCP.</td>
</tr>
<tr>
<td>Trigger Port</td>
<td>From and To port ranges of the special application. For example, to track the H.323 protocol, the From and To ports should be 1720.</td>
</tr>
<tr>
<td>Target Port</td>
<td>From and To port ranges for the target port listening for the special application.</td>
</tr>
<tr>
<td>Interval</td>
<td>Specify the interval between 50 and 30000 between two continuous sessions. If the interval exceeds this time interval setting, the sessions are considered to be unrelated.</td>
</tr>
<tr>
<td>IP Replacement</td>
<td>Select the IP replacement according to the application. Some applications embed the source host's IP in the datagram and normal NAT would not translate the IP address in the datagram. To make sure the network address translation is complete, IP replacement is necessary for these special applications, such as H.323.</td>
</tr>
<tr>
<td>Allow sessions initiated from/to the 3rd host</td>
<td>Decide whether the sessions can start from/to a third host. To prevent hacker attacks from a third host, this feature usually is not allowed. However, for some special applications, such as MGCP in a VOIP application, a session initiated from a third host is permitted. For example, assume Client A is trying to make a phone call to a host B. Client A tries to communicate with the Media Gateway Controller (MGC) first and provides host B's number to MGC. Then MGC checks its own database to find B and communicate with B to provide B the information about A. B uses this information to communicate directly to A. So initially, A is talking to MGC, but the final step has B initiating a session to A. If the third-party host-initiated session is not allowed in this example, the whole communication fails.</td>
</tr>
</tbody>
</table>
Configuring URL Blocking

Using the URL Blocking menu, you can configure the Gateway to block access to certain Web sites from local computers by entering either a full URL address or keywords of the Web site. The Gateway examines all the HTTP packets to block the access to those particular sites. This feature can be used to protect children from accessing inappropriate Web sites. You can block up to 50 sites.

Using URL blocking, you can also make up to 10 computers exempt from URL blocking and have full access to all Web sites at any time.

To display the URL Blocking menu, click Firewall in the menu bar and then click the URL Blocking submenu. Figure 49 shows an example of the menu.

Note: The URL Blocking submenu is not available in the menu bar if Enable Firewall Module is disabled in the Security Settings (Firewall) menu (see page 73).

Tip: The Gateway provides a Schedule Rules feature that lets you configure URL blocking for certain days, if desired. For more information, see “Configuring Schedule Rules” on page 92.

Figure 49. URL Blocking Menu
To enable URL blocking:

1. In the URL Blocking menu, check **Enable Keyword Blocking** if it is not checked and click **Apply**.

2. To exempt a computer from URL blocking, enter the computer’s MAC address in the **Add exempted PC** field and click the **Add Trusted Host** button. The MAC address you entered appears in the **Exempted PC List**.
   - Repeat this step for each additional computer (up to 10) you want to make exempt from URL blocking.
   - To remove a computer from being exempted, use the **Delete** or **Delete All** buttons next to the field to delete selected or all MAC addresses.

3. To block a site, click in the **Keyword/Domain Name** field, enter keyword or domain name of the site you want to block, and click **Add Keyword**. The keyword or domain appears in the **Blocked Keyword/Domain List**.
   - Repeat this step for each additional keyword or domain (up to 50) you want to make exempt from URL blocking.
   - To remove a site from being blocked by a keyword or domain name, use the **Delete** or **Delete All** buttons next to the field to delete selected or all keywords and/or domains.

4. Click **Apply**.
Configuring Schedule Rules

Schedule rules work with the Gateway’s URL blocking feature (described on page 90) to tell the Gateway when to perform URL blocking.

To access the Schedule Rule menu, click Firewall in the menu bar and then click the Schedule Rule submenu in the menu bar. Figure 50 shows an example of the menu.

Note: The Schedule Rule submenu is not available in the menu bar if Enable Firewall Module is disabled in the Security Settings (Firewall) menu (see page 73).

![Schedule Rule Menu](image)

Figure 50. Schedule Rule Menu

By default, the Gateway is configured to apply schedule rules to URL blocking 24 hours every day. To change these settings:

1. To change the days when schedule rules are applied to URL blocking, uncheck Every Day under Week Day. Then check the days when you want to apply schedule rules to URL blocking.

2. To change the hours when schedule rules are applied to URL blocking, uncheck All Day. Then specify the start and end times when you want to apply schedule rules to URL blocking. Select AM or PM, where AM refers to times from Midnight to Noon and PM refers to times from Noon to Midnight.

3. Click Apply.
Configuring Email and Syslog Alerts

The Gateway inspects packets at the application layer, and stores TCP and UDP session information, including timeouts and number of active sessions. This information is helpful when detecting and preventing Denial of Service (DoS) and other network attacks.

If you enabled the Gateway’s firewall or content-filtering feature, you can use the Email/Syslog Alert menu to configure the Gateway to send email notifications or add entries to the syslog when:

- Traffic is blocked
- Attempts are made to intrude onto the network
- Local computers try to access block URLs

You can configure the Gateway to generate email notifications or syslog entries immediately or at a preconfigured time.

To access the Email/Syslog Alert menu, click Firewall in the menu bar and then click the Email/Syslog Alert submenu in the menu bar. Figure 51 shows an example of the menu.

The menu has three sections:

- The top area lets you configure the Gateway to send email notifications.
- The middle area lets you configure to add syslog entries.
- The bottom area lets you define the alerting schedule.

Note: The Email/Syslog Alert submenu is not available in the menu bar if Enable Firewall Module is disabled in the Security Settings (Firewall) menu (see page 73).
Figure 51. Email/Syslog Alert Menu
Configuring Email Alerts

The following procedure describes how to configure the Gateway to send email notifications. This procedure assumes that your mail server is working properly.

1. In the Email/Syslog Alert menu, under **Mail Server Configuration**, enter the following information:
   - **SMTP Server Address** = IP address of the SMTP server that will forward the email notification to recipients.
   - **Sender’s Email Address** = name that will appear as the sender in the email notifications.

2. Under **Mail Server Authentication**, enter the following information:
   - **User Name** = your email name.
   - **Password** = your email password.

3. Under **Recipient list**, click **Add**. When the Recipient Adding menu appears (see Figure 52), enter the name of the person who will receive email notifications and the person’s email address, and then click **Apply**. (Or click **Back** to return to the Email/Syslog Alert menu or **Cancel** to cancel any selections you made.) If you clicked **Apply**, the email account is added to the **Recipient list**. To send email to additional email accounts (up to 4), repeat this step.

4. To change the settings for an email recipient, click the radio button to the left of the recipient you want to change and click the **Edit** button. When the Recipient Adding menu appears, edit the settings as necessary and click **Apply**.

5. To delete an email recipient, click the radio button to the left of the recipient and click **Delete**. No precautionary message appears before you delete the email recipient.

6. Click **Apply**.

![Recipient Adding Menu](image)
Configuring Syslog Entries

To have the Gateway add a syslog entry when traffic is blocked, attempts are made to intrude onto the network, or local computers try to access blocked URLs:

1. In the Email/Syslog Alert menu, under **Syslog Server Configuration**, enter the syslog server address.
2. Click **Apply**.

Configuring Alert Options

Using the options in the **Alert Options** area, you can configure the Gateway to send an email to recipients you define in this menu and/or send entries to a syslog defined in this menu if the Gateway detects an intrusion.

To configure the Gateway to send an email to the configured email addresses if it detects an intrusion:

1. Perform steps 1 through 3 under “Configuring Email Alerts” on page 95.
2. Under **Alert Options**, check **Send Email** next to **When intrusion is detected**.
3. Click **Apply**.

   To configure the Gateway to send an entry to a syslog if it detects an intrusion:

1. Perform step 1 under “Configuring Syslog Entries” on page 96.
2. Under **Alert Options**, check **Send Syslog** next to **When intrusion is detected**.
3. Click **Apply**.
Configuring DMZ Settings

If you have a local client computer that cannot run an Internet application properly behind the NAT firewall, you can configure it for unrestricted two-way Internet access by defining it as a Virtual Demilitarized Zone (DMZ) host. Adding a client to the DMZ may expose your local network to various security risks because the client in the DMZ is not protected by the firewall.

To access the DMZ (Demilitarized Zone) menu, click **Firewall** in the menu bar and then click the **DMZ** submenu in the menu bar. Figure 53 shows an example of the menu.

**Note:** The **DMZ** submenu is not available in the menu bar if **Enable Firewall Module** is disabled in the Security Settings (Firewall) menu (see page 73).

To configure DMZ settings:

1. In the DMZ (Demilitarized Zone) menu, check **Enable DMZ Host**. The 2 rightmost fields next to this option become available.

2. Enter the last two octets in the IP addresses of the computer to be used as the DMZ server.

3. Click **Apply**.

![Figure 53. DMZ (Demilitarized Zone) Menu](image-url)
Using the Tools Settings Menu

Using the **Tools Settings** menu, you can reset the Gateway and restore the device’s factory default settings. To access the Tools Settings menu, click **Tools** in the menu bar. Figure 54 shows an example of the menu.

**Note**: To reboot the Gateway and retain any customized settings, use the Reboot menu (see “Using the Reboot Menu to Reboot the Gateway” on page 99).

![Tools Settings Menu](image)

**Figure 54. Tools Settings Menu**

To reset the Gateway and restore its factory default settings:

1. Click **Factory Reset**. The warning message in Figure 55 appears.

2. Click **OK** to restore the Gateway’s factory default settings or click **Cancel** to retain the Gateway’s current settings.
Using the Reboot Menu to Reboot the Gateway

Using the Reboot menu, you can reset the Gateway and retain all changes that have been made to the Gateway’s factory default settings. To access the Reboot menu, click Tools in the menu bar and then click the Reboot submenu in the menu bar. Figure 56 shows an example of the menu.

To reboot the Gateway and retain all changes made to its factory default settings:

1. In the Reboot menu, click Apply. The precautionary message in Figure 57 appears.
2. Click OK to reboot the Gateway or click Cancel to not reboot it. If you clicked OK, the reboot is complete when the POWER LED stops blinking and you will need to log in to the Web interface again.
Figure 57. Precautionary Message When Rebooting the Gateway

**Viewing Status Information**

The Status page is a read-only screen that shows the:

- Connection status for the Gateway’s WAN and LAN interfaces
- Firmware and hardware versions
- Any illegal attempts to access your network
- Information about all DHCP clients currently connected to the Gateway
- Network, LAN client, and cable modem system event logs, with buttons for clearing or refreshing the logs and releasing the IP
- LAN client log, with buttons for refreshing and releasing IP addresses

The Status menu appears when you first log in to the Web management interface. You can also display it by clicking **Status** in the menu bar. Figure 58 shows an example of the status information shown.
Configuring Your Gateway

Viewing Cable Status Information

The Cable Status page is a read-only screen that shows your cable initialization procedures, along with the cable upstream and downstream status.

The Cable Status menu appears when you first log in to the Web management interface. You can also display it by clicking **Status** in the menu bar and then clicking the **Cable Status** submenu. Figure 59 shows an example of the cable status information shown.
Figure 59. Example of Cable Status Page
Appendix A - Compliances

FCC Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against radio interference in a commercial environment. This equipment can generate, use and radiate radio frequency energy and, if not installed and used in accordance with the instructions in this manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause interference, in which case the user, at his own expense, will be required to take whatever measures are necessary to correct the interference. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

The device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

FCC Caution: Any changes or modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate this equipment.

IEEE 802.11b or 802.11g operation of this product in the U.S.A is firmware-limited to channels 1 through 11.

IMPORTANT NOTE:

FCC Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

The availability of some specific channels and/or operational frequency bands are country dependent and are firmware programmed at the factory to match the intended destination. The firmware setting is not accessible by the end user.

Note to CATV System Installer - This reminder is provided to call the CATV systems installer's attention to Section 820-93 of the National Electric Code which provide guideline for proper grounding and, in particular, specify that the Coaxial cable shield shall be connected to the grounding system of the building, as close to the point of cable entry as practical.
Appendix B - Technical Specifications

COMPATIBILITY

- Platform independent – works with PC, OSX, Linux, MAC, UNIX
- DOCSIS 1.0/1.1/2.0/3.0 compliant
- IEEE 802.3, 802.3u
- SPI Firewall meet ICSA Guidelines
- 1 USB 2.0 Host Port

NETWORK INTERFACES

- 4 ports 10/100/1000 MDI/MDIX auto sensing switch
- TR-68 coloring for 1 USB 2.0 Connector Type B
- Cable Interface F type female 75ohm

NETWORKS PROTOCOLS

- Application Layer: DHCP Client/Server; DNS (Proxy & Dynamic), HTTP, FTP, TFTP; SNMPv1/2, Telnet, SSH
- Transport Layer: TCP (TACACS), UDP (RADUIS)
- Network Layer: ARP, ICMP, IPv4, IPv6, IPSec, RIPv1/2
- Data Link Layer: 802.1d transparent bridging, VPN Pass-through, PAT, VLAN, Static Routing; ARP; QoS
- Physical Layer: Ethernet 10/100/1000Base T

SOFTWARE FEATURES

- Full-featured CLI provides enhanced troubleshooting and setup
- DHCP client/server
- IPV6 support coexist IPV4
- RIP v1/v2
- Downloadable configuration files allow for easy setup and installation.
- Universal Plug and Play (UPnP) enabling any UPnP devices seamlessly
- SAMBA for USB Host port connection of USB hard drives
- MIB object that executes any CLI command
• GUI/SNMPv1/2/3/CLI addition to present PHY usage (multiple channels parameters)
• VLAN Tagging (Qin Q; 802.1p/q)
• 8 SSIDs support with full wireless capabilities for each SSID
• Port Forwarding
• Independent resets for downstream and upstream blocks
• Fragmentation and concatenation enabling Quality of Server (QoS) features
• Supports 64/128/256 bit RC4 authentication and encryption
• WAN-LAN transparent bridging
• SOAP, HTTP and HNAP
• XML Configuration

SECURITY
• Password protected configuration access
• Stateful Packet Inspection (SPI)
• Network Address Translation (NAT)
  – Many-to-one NAT
  – Many-to-many NAT
• Application Level Gateways (ALG)
• Intrusion Detection
• Denial of Service (DoS) prevention
• Trojan Horse Prevention
• Smart Tracking
• Domain & URL Filtering
• Multiple User Profiles
• Dynamic Address-User Mapping
• Web based authentication
• Comprehensive Logging
• VPN Termination Pass-Through (IPSec, PPTP, L2TP, IKE)
• DMZ
CHANNEL BONDING

- Downstream: Up to 8 channels
- Upstream: Up to 4 channels

RECEIVER

- Demodulation: 64/256QAM
- Bandwidth: 6MHz
- Max. Data Rate per Channel: 30Mbps( 64QAM), 43Mbps( 256QAM)
- Frequency Range: 88–1002MHz
- Signal Level: -15dbmV to + 15dbmV
- Input Impedance: 75Ω
- Input Return Loss: >6 dB over 88MHz – 1002 MHz

TRANSMITTER

- Modulation:
  - TDMA:QPSK, 8,16,32,64QAM,
  - S-CDMA: QPSK, 8,16,32,64,128QAM
- Bandwidth:
  - TDMA:200, 400, 800, 1600, 3200,6400kHz
  - S-CDMA: 1600, 3200, 6400kHz
- Max. Data Rate per Channel:
  - 320,640,1280,5120,10240kbps (QPSK)
  - 480, 960,1920,3840,7680,15360kbps (8QAM)
  - 640, 1280, 2560,5120,10240,20480kbps (16QAM)
  - 800,1600,3200,6400,12800,25600kbps (32QAM)
  - 960, 1920, 3840, 7680,15360,30720kpbs (64QAM)
  - 8960,17920,35840kbps (128QAM)
- Frequency Range: 5MHz- 42MHz
- Output Signal Level:
  - TDMA: +8 to +54dBmV (32QAM, 64QAM);+8 to +55dBmV (8QAM, 16QAM);+8 to +58dBmV (QPSK)
  - S-CDMA: +8 to +53dBmV( all modulation)
Output Return Loss: > 6dB

WLAN
- 1T1R/1T2R/2T2R modes
- 300Mbps PHY data rate
- Supports IRRR 802.e WiFi Multimedia (WMM)
- Support 8 SSIDs
- WMM-QoS
- WPS, WPA, WEP (64/128-bit), TKIP,AES, MAC Filtering
- WPS push button for WiFi Protected Setup with PIN
- MAC address Access Control

ENVIRONMENT
- Operating Temperature: 32 °F (0°C) to 104°F (40°C)
- Operating Humidity: 10% to 90%
- Storage Temperature: -40°F (-40°C) to 140°F (80°C)

REGULATORY /STANDARD COMPLIANCE
- FCC Part 15B Class B
- UL/Cul:609650-1
- WiFi 802.11b /g/ n
- DOCSIS 3.0

DIMENSIONS (L x W x H) without packaging
- 9.84x 6.30 x 1.65 in
- 25 x 16 x 4.2 cm

WEIGHT: 508g/1.12lb

LEDs: Power, DS (Downstream), US (Upstream), Online, ETH (4), Wireless, USB

POWER SUPPLY: AC on board; AC power: 90~120V

* Actual speeds will vary based on factors including networks configuration and service tiers.
